Molybdenum Tungsten Tantalum Evaporation Boat For High Temperature Applications

Item Number: KME01

Introduction

Evaporation boat sources are used in thermal evaporation systems and are suitable for depositing various metals, alloys and materials. Evaporation boat sources are available in different thicknesses of tungsten, tantalum and molybdenum to ensure compatibility with a variety of power sources. As a container, it is used for vacuum evaporation of materials. They can be used for thin film deposition of various materials, or designed to be compatible with techniques such as electron beam fabrication.
